

The Vascular Anomalies Center team at Children's Hospital Boston recently became aware of three cases of Wilms Tumor in young patients with CLOVES syndrome. While Wilms tumor has been associated with some overgrowth related disorders, such as Beckwith-Wiedemann Syndrome, it is a new finding in patients with CLOVES syndrome.

Our recommendation for Wilms tumor screening is serial ultrasounds performed every three months up to age 8 years after which there is not thought to be any increased risk of developing Wilms tumor.

Questions may be addressed to your child's pediatrician or to the Vascular Anomalies Center, Children's Hospital Boston, at 617-355-5226.
